

Backend (API Gateway)	80%	All RESTful API endpoints for user management and booking handling are operational. MongoDB connection is stable. Security middleware (JWT) is implemented.
ML Engine (Pricing)	85%	The XGBoost regressor for dynamic pricing is fully trained and deployed as an API. It successfully returns price quotes based on input parameters.
ML Engine (Recommender)	80%	Random Forest Classifier for vehicle recommendation is active. It correctly classifies inventory volume into Small/Medium/Large categories.
Chatbot (Rasa)	50%	Intent recognition for basic queries (status, pricing) is working. Contextual conversation handling and integration with the live database need refinement.
GPS Tracking	60%	Integration with Google Maps API for static routing is done. Real-time driver location simulation is currently being implemented.

8.3 Implemented Core Modules with Code Analysis

This section details specific code implementations that have been completed. These snippets demonstrate the practical application of the logic discussed in Chapter 4 (Methodology).
