

Status Explanation:

This module is **75% complete**. The code successfully handles the logic for minimum base fares (ensuring no quote is too low) and simultaneously returns both the package recommendation and the price. The only pending task is implementing a retraining pipeline to update the .pkl files automatically as new data comes in.

8.3.3 Frontend Integration (React Native)

The user interface has been built using React Native to ensure cross-platform compatibility. The "Inventory Selection" screen is fully functional, allowing users to increment item counts which updates the state used for price calculation.

Code Snippet 3: Inventory Item Component (InventoryScreen.js)

```
import React, { useState } from 'react';
import { View, Text, TouchableOpacity, StyleSheet } from 'react-native';
import { useDispatch } from 'react-redux';
import { updateInventory } from '../redux/bookingSlice';

const InventoryItem = ({ itemName, isFragile }) => {
  const [quantity, setQuantity] = useState(0);
  const dispatch = useDispatch();

  const handleIncrement = () => {
    const newQty = quantity + 1;
    setQuantity(newQty);
    // Redux action to update global store
    dispatch(updateInventory({ name: itemName, qty: newQty, fragile: isFragile }));
  };

  const handleDecrement = () => {
    if (quantity > 0) {
      const newQty = quantity - 1;
      setQuantity(newQty);
      dispatch(updateInventory({ name: itemName, qty: newQty, fragile: isFragile }));
    }
  };

  return (
    <View style={styles.card}>
      <View>
```
